SHEERSH KACHHWAHA

Investment Cases, Scenario Modelling & AI-Augmented Decision Support

Sheersh0802@gmail.com | London, UK

PROFESSIONAL SUMMARY

Analyst combining a quantitative renewable-energy and engineering background with financial and investment decision-support: scenario modelling, sensitivity analysis, NPV and payback, delivered as recommendations a team can act on quickly. Increasingly applying AI-augmented workflows to speed that process up without losing rigour. Equally comfortable in technical detail and executive-ready narrative — energised by fast-moving, culture-led businesses where analysis earns its place through curiosity and follow-through, not just correctness.

CORE STRENGTHS

Financial & Investment Analysis

- Scenario and sensitivity modelling; NPV, discount rate and payback analysis
- Feasibility and investment-case development for capital-intensive assets
- Hypothesis-led problem structuring (MECE, issue trees)

ESG & Risk Evaluation

- ESG and sustainability risk evaluation for asset and policy decisions
- Lifecycle assessment (GaBi) and comparative system evaluation
- Regulatory- and compliance-aware framing of technical risk

AI & Quantitative Tools

- Excel (advanced modelling), SQL, Python
- Prompt engineering and agentic-AI workflows for faster iteration
- Statistical monitoring and trend analysis (Minitab, ANOVA)

Stakeholder & Cross-Functional Delivery

- Translating technical analysis into executive-ready recommendations
- Cross-functional and public stakeholder communication
- Community and policy engagement across international, cross-border projects

PROFESSIONAL EXPERIENCE

Analyst, Retail Advisory - Genpact, London

July 2026 – Present

- Supporting structured, hypothesis-led analysis (MECE / issue-tree frameworks) on cross-industry client advisory engagements — building the same rigour developed academically in a live, client-facing setting

PROJECT EXPERIENCE

Kingston University & Independent Projects

Investment Case Development — Renewable vs. Conventional Energy Systems

Built a comparative investment case across renewable and conventional energy assets — CapEx, OpEx, LCOE, discount rate, carbon liability.

Outcome: quantified renewables as the structurally superior long-term investment — near-zero lifecycle maintenance cost offsets higher upfront CapEx, with materially lower carbon liability, supporting a risk-adjusted case for reallocating capital away from coal and petroleum.

Procurement & Materials Cost Analysis

Modelled system efficiency and energy yield for renewable assets (WindPro, SQL); benchmarked performance ratios to isolate cost and optimisation levers.

Outcome: delivered a validated material-substitution recommendation (carbon steel over tool steel), directly actionable for procurement and sourcing strategy.

Asset Lifecycle & ROI Modelling

Built a lifecycle model across wind and solar asset classes to determine profit drivers, cost-recovery timelines and supply-chain risk.

Outcome: identified a 4–6 year ROI horizon and surfaced raw-material supply-chain risk on wind blades and solar panels, usable directly in long-term asset planning.

EDUCATION & CERTIFICATIONS

MSc Renewable Energy Engineering — Kingston University, London *2026*

Advanced modelling across solar, wind and hydrogen systems. Dissertation: ANOVA-based statistical instrumentation monitoring (Minitab/Excel) and system lifecycle determination (GaBi).

BSc Environmental Sciences — Fergusson College, Pune *2024*

Environmental impact assessment, ESG frameworks, comparative energy-system evaluation.

CORE SKILLS

Scenario/NPV Modelling ★★★☆☆ Minitab ★★★★☆

AI & Programming Prompt Engineering ★★★★☆ Python ★★☆☆☆

Sustainability & Risk ESG Metrics ★★★★☆ Lifecycle Assessment ★★★☆☆ Feasibility Analysis ★★★★☆
