SHEERSH KACHHWAHA

Investment Cases, Scenario Modelling & AI-Augmented Decision Support

Sheersh0802@gmail.com | London, UK | linkedin.com/in/sheersh-kachhwaha | github.com/sheersh-star

Professional Summary

Retail Advisory Analyst at Genpact, combining a quantitative renewable-energy and engineering background with financial and investment decision-support: scenario modelling, sensitivity analysis, NPV and payback, delivered as recommendations a team can act on quickly. Increasingly applying AI-augmented and agentic workflows to speed that process up without losing rigour, both in client delivery and in independent writing on the same shift. Equally comfortable in technical detail and executive-ready narrative; energised by fast-moving, culture-led businesses where analysis earns its place through curiosity and follow-through, not just correctness.

Core Strengths

Financial & Investment Analysis: Scenario and sensitivity modelling; NPV, discount rate and payback analysis; feasibility and investment-case development for capital-intensive assets; hypothesis-led problem structuring (MECE, issue trees).

AI & Agentic Workflows: Prompt engineering and agentic-AI workflows for faster iteration; planning and presenting agentic, Goal-as-a-Service solutions to client stakeholders; Excel (advanced modelling), SQL, Python; statistical monitoring (Minitab, ANOVA).

ESG & Risk Evaluation: Sustainability risk evaluation for asset and policy decisions; lifecycle assessment (GaBi) and comparative system evaluation; regulatory- and compliance-aware framing of technical risk.

Stakeholder & Delivery Management: Translating technical analysis into executive-ready recommendations; client-facing presentations across cross-industry advisory engagements; team organisation and project management across concurrent workstreams.

Professional Experience

Analyst, Retail Advisory; Genpact, London Jul 2026 - Present

- Supporting structured, hypothesis-led analysis (MECE / issue-tree frameworks) on cross-industry client advisory engagements; building the same rigour developed academically in a live, client-facing setting.
- Organising and managing delivery across three concurrent engagement workstreams (Finance, Real Estate, and Blueprinting & Solution Identification), spanning a large-scale retail account and a CPG/retail-related account.
- Leading client-facing presentations on agentic, Goal-as-a-Service solutions; translating an emerging AI delivery model into a business case stakeholders can plan around and commit to.

Project Experience

Frozen Dessert Market Console (independent, 2026)

Built a Python data pipeline and synthesis engine into a self-updating, UK-first market-intelligence dashboard for the frozen dessert industry, covering regulatory exposure, production trends, and equipment risk via a Problem/Action/Impact narrative.
Outcome: a zero-dependency, self-updating console; dropping a new data file updates every dependent panel automatically, with no manual re-run required.

Kingston University & Independent Projects

The Fair Energy Project; Wind Farm Proposal, Mablethorpe (MSc coursework)

Sited and modelled a 5-turbine (Vestas V90, 2.0 MW each) wind farm at Mablethorpe beach, Lincolnshire, solo: Weibull wind resource estimation, capacity factor and annual yield, and a full CAPEX/OPEX/LCOE financial case.
Outcome: a profit-positive case within 6 years (5.5-year payback, 43.3% capacity factor, 37,962 MWh/year), sited to preserve the undisturbed Theddlethorpe dunes while creating 30-40 new local skilled/semi-skilled roles.

Investment Case: Renewable vs. Conventional Energy Systems

Built a comparative investment case across renewable and conventional energy assets: CapEx, OpEx, LCOE, discount rate, carbon footprint, and community impact.
Outcome: quantified renewables as the structurally superior long-term investment; near-zero lifecycle maintenance cost offsets higher upfront CapEx, with a materially lower carbon footprint, supporting a risk-adjusted case for reallocating capital away from coal and petroleum.

Procurement & Materials Cost Analysis

Modelled system efficiency and energy yield for renewable assets (WindPro, SQL); benchmarked performance ratios to isolate cost and optimisation levers.
Outcome: delivered a validated material-substitution recommendation (carbon steel over tool steel), directly actionable for procurement and sourcing strategy.

Education

MSc Renewable Energy Engineering; Kingston University, London Sep 2024 - Nov 2025

Advanced modelling across solar, wind and hydrogen systems. Dissertation: "StatInstrument: Statistical Monitoring of Instrumentation," ANOVA-based statistical monitoring of wind, solar, and fuel-cell system instrumentation. School Representative, School of Engineering, Computing and the Environment.

BSc Environmental Sciences; Fergusson College, Pune 2021 - 2024

Environmental impact assessment, ESG frameworks, comparative energy-system evaluation. Grade: 8 CGPA. Undergraduate thesis: "Contemporary and renewable energy resources: Cost study." Placement Coordinator; badminton, sports team.

Additional

Software: Excel (advanced modelling), SQL, Python, Minitab, GaBi, WindPro. | **Languages:** English and Hindi (fluent), Spanish (in progress).

Independent Writing: Substack (sheersh13.substack.com), on regulation, cost pressure, and AI reshaping retail/CPG; twenty-two pieces to date.
